Driverfreetracker is the leading software in the download driver category, with 515.000+ downloads since 2007.Driverfreetracker focuses on drivers for USB devices, sound, graphics, network and video. All downloads are 100% virus free. This paper presents the results of a study in which the drivers of 12 Apple Macintosh models were downloaded and compared with known working versions of the same drivers to assess the quality and reliability of the downloads. These downloads were performed using a newly released software, DriverFreetracker, which is designed to rapidly locate drivers for hardware devices. We downloaded and evaluated the 12 drivers using the same methodology that Apple uses to verify their official driver downloads. After validating the results of the downloads, we performed a limited analysis of the drivers. We found a small number of drivers for which DriverFreetracker did not download the correct drivers, or which downloaded the wrong drivers for the Mac model. We also identified a few drivers that were not compatible with Mac OS X 10.8.5 and some drivers that were not compatible with Mac OS X 10.7. In addition to assessing the functionality of the drivers, we also assessed the quality and reliability of the downloads using various criteria, including the number of times the driver had been downloaded and the number of people who had downloaded the driver. The results show that the average number of times a driver had been downloaded was over seven times, and the average number of people who had downloaded the driver was over a hundred. This suggests that if a driver is available for download, there is a good chance that many people will be downloading it, and some of those people may do so again. These results also suggest that the drivers that were not compatible with Mac OS X 10.8.5 are those drivers that had been downloaded only a few times. We also found that all of the drivers that were compatible with Mac OS X 10.8.5 were available to download from Apple's official website, but many of the drivers that were compatible with Mac OS X 10.7.5 were not. We discovered that none of the drivers that were not compatible with Mac OS X 10.8.5 were listed on Apple's website. To us, this seems 2d92cc491b
